- Laser Blepharoplasty (saggy eyelids)
- Body contouring by Endermologie
- Cellulite removal
- Laser teeth whitening
- Chemical peels
- Tattoo removal
- Hair restoration
- Collagen and Botox injections
- Permanent Make-up
- Plastic Surgery

Not all services offered at all facilities.

Ultrasonic Liposuction

Ultrasonic liposuction will help you attain the sleeker silhouette that you desire. A slimmer you. Uncover your natural beauty.

What is Liposuction?

Liposuction is designed to remove localized deposits of excess fat anywhere on your body, that are resistant to diet and exercise. A small tube called a canula is connected to a gentle vacuum machine. This is then inserted into the fatty tissue through tiny incisions placed in inconspicuous locations on the skin. The physician gently moves the canula around under your skin, removing the unwanted fat. The result is a reshaping of bulging areas into more attractive contours. Liposuction is an excellent method of spot reduction but is not a substitute for weight loss.

How is the area anesthetized?

The tumescent technique involves injection beneath the skin of large volumes of a saline solution mixed with local anesthesia and adrenaline, a naturally occurring hormone that shrinks blood vessels. The solution anesthetizes the area, ensuring a painfree procedure. The fluid also expands the fat, pushing it further away from the nerves and blood vessels, so there is less chance of damage.

What is ultrasonic liposuction?

Ultrasonic liposuction involves the use of high frequency sound waves to liquefy the fat cells under the skin, thereby allowing the fat to be gently aspirated away. These sound waves act primarily on the fat cells and really have no effect on the other tissues. Ultrasonic liposuction has the advantage of minimizing pain, bleeding, bruising, and swelling after the procedure. With Ultrasonic liposuction, we can achieve smoother results, remove difficult fibrous fatty deposits and improve your recovery time. Ultrasonic liposuction also involves less blood loss.

before

Who is a good candidate for liposuction?

There are no definite weight or age restrictions for ultrasonic liposuction. We usually achieve the most dramatic results with people who have localized areas of protruding fat. Patients who are within thirty pounds of their ideal weight and have been stable at that weight can also benefit from ultrasonic liposuction. Good skin elasticity permits the skin to shrink easily to the newly reduced contour.

after

Individual results may vary.

What areas are most frequently treated?

In women, the single most frequently treated areas are the outer thighs, followed by the stomach, hips, buttocks, knees, lower leg, cheeks and double chins. In men, the flank area or "love handles" are treated most frequently followed by abdomen and neckline.

What will the recovery be like?

You will have one or two small stitches to close the tiny incisions. You will wear a snug elastic dressing, girdle or body stocking over the treated area for three to four weeks. You will go home after the procedure and rest for 24 hours, after which you may gradually increase your activities back to normal levels.

Liposuction seems very simple and safe. Are there any dangers?

Although liposuction is very safe and effective, it is a surgical procedure and may cause complications such as infection, bleeding, damage to underlying structures and nerve damage. In addition, aesthetic complications such as skin irregularity or waviness may occur if too much fat has been removed. Fortunately, complications are uncommon and most patients are satisfied with their results.
